Project description

Arman is a brokerage that aims to convert the traditional in-person registration process into an online format. This process consists of two distinct phases. The initial phase involves obtaining a unique code from the Comprehensive Customer Information System, commonly known as the Sajam code. Possessing the Sajam code is a prerequisite for engaging in stock market operations in Iran. The second phase entails the registration process for each brokerage.

Contextual situation

- There are two types of people who may join Arman:
 - a. Users who are already experienced traders. These users possess a 'Sajam badge' (an Iranian trader certificate).
 - b. Users who have recently developed an interest in trading. These users are not yet familiar with the requirements, such as the 'Sajam badge,' and the overall process.
- Faced with economic challenges, Arman found it imperative to expand their business by onboarding new users.
- The onset of the COVID-19 pandemic significantly hindered user registration conversion due to heightened physical requirements.
- The rapid growth of the stock market in Iran prompted Arman to act swiftly, aiming to stay competitive in the industry.
- Governmental brokerages had the advantage of advertising in citizen offices, where physical presence was mandatory for Sajam registration.
- We were experiencing customer loss in the exhausting and lengthy physical registration processes.

Goals

1. Convert potential users into active customers.
2. Enable users to seamlessly register and address any issues encountered in the process.
3. Facilitate users in joining the stock market through Arman's registration flow.
4. Encourage users to become members of the customer club.
5. Achieve a 30% conversion rate from individuals initiating the flow to signing the contract.

B

Rolling up our sleeves 🧤

Design Issues 🙋

- Stringent regulations from supervisory institutions in both Sajam and the Securities & Exchange Organization.
- The complexity of a multi-dimensional flow poses a design challenge.
- Uniqueness in the market – being the first brokerage to integrate Sajam and brokerage registration, resulting in the absence of direct competitors in this particular aspect.

Timeline 📅

Let's Jump in UX! 🤿

Brief session

We initiated the UX research process with a brief meeting that included our designers and stakeholders. During this session, we strategically posed questions to guide the discussion and maintain the stakeholders' focus on our designated topic. This helped us gain valuable insights into what stakeholders expect. On the flip side, stakeholders shared their views on how they believe customers behave, providing a useful starting point for our research. Towards the end, we also touched on other brokerages in the field, getting some updates on their activities.

interview

It was now time for interviews, a crucial step in understanding people's experiences, thoughts, and actions. While maintaining the focus on the registration process, we encouraged participants to share their challenges both before and after this flow. This allowed us to gather insights into their pain points, which we could later use as

Competitive analysis

Earlier, we discussed the two phases of the registration flow. For the Sajam registration, our only options were to analyze the physical process or explore the official Sajam website. In this context, we personally navigated through the physical flow to gain a comprehensive understanding. Additionally, we conducted a thorough analysis of the sole online solution available. Moving on to the second phase, which involved brokerage registration, we analyzed seven of the top brokerages currently in the market.

various types of potential customers. The interviews were guided by 10 key questions to keep the discussion centered on the intended topic.

Key insights from user research 🕵️

1. Waiting in long lines is a significant pain point for users who have undergone the physical registration process.
2. Obtaining a Sajam badge for trading in Iran is mandatory, and the process can be confusing and frustrating.
3. Individuals accustomed to trading in the Iranian stock market are aware that the processes are slow and time-consuming. However, newcomers often experience frustration during the flow.
4. The forms and questions are lengthy but generally straightforward. Adding brief explanations for certain sections might be helpful.
5. During physical registration, having a counter officer available to answer questions is beneficial. However, finding a free officer can be challenging, especially in the Sajam registration process.
6. Customers generally prefer visiting the brokerage branch over citizen offices, often due to less favorable experiences at the citizen offices.
7. Most people in this field are accustomed to calling customer support or personally visiting the branch for assistance with their issues.
8. Usually, you will receive your Sajam badge a few minutes after completing your registration. Therefore, we could consider guiding people to the next step while waiting for Sajam to confirm the user. This approach could help reduce one of the waiting gaps. 💡
9. There are two distinct behaviors observed among our users. The first group comprises individuals who have typically entered trading independently and engage in full-time trading. These professionals meticulously read all contracts and related texts. The second group, mainly invited by marketers, consists of casual users who view trading as a hobby. They tend to rely on marketers to handle every step, putting less effort into the process. The first type is considered more valuable for Arman. ★

B

Analyzing old flow to design the new

Old Flow of registering in an Iranian Brokerage 🤖

Old flow Journey map 🚗

	1. Register in Sajam	2. Register in a brokerage	3. Take the exam
User actions	1. Finding right counter office to go 2. Going to the counter office in-person 3. Pay the registration fee 4. Filling forms	1. Go to a branch of a brokerage or go online in the brokerage website 2. filling forms	1. Wait for the exam time 2. Watch small course about the exam in the branch 3. Take the exam
Pain points	1. Risk of getting corona virus 2. Transporting costs 3. Registration cost 4. Waiting in long exhausting lines 5. Lack of proper trouble shooting 6. A lot of marketers who come to attract you	1. Transporting Cost (if physical) 2. Lack of help and support from counter officer (if online) 3. What documents do user need in the registration flow	1. Stressed out because of exam 2. Lack of knowledge 3. No sample questions?
Touch Points	1. Counter officer 2. Sajam website	1. Officer in the branch 2. Brokerage website	1. Examiner 2. Officer in the branch 3. Exam pages online
Emotions	🤔	😊	😓
Possible solutions	1. Doing it online 2. Arman have no problem with paying for customers to register in Sajam 3. Create proper channels for trouble shooting 4. Proper status feedback 5. Add gamification to filling forms	1. Prepare online way to do it. 2. Prepare live customer support in flow. 3. Design Flows aligned with user behavior. 4. Notify user about current step.	1. Do not stress customers 2. Telling them this is almost last step 3. Good introduction 4. Prepare a video to teach them main topics of exam

B

Now that we've gained a profound understanding of both users and the various perspectives on flows, it's time to embark on designing our flow map. The primary objective is to guide a potential user seamlessly through the journey to becoming an actual customer. This flow map will serve as a handbook for both designers and developers, providing insights into different stages and states of the process. Given the intricate nature of the flow, we opted to delineate a well-defined framework, and what better starting point than the traditional registration flow?

We encounter two primary challenges in our current flow that need resolution before progressing:

- 1. Lengthy Flow and Waiting Gaps:** Users may need to exit the flow temporarily and return later, driven primarily by mandatory waiting periods mandated by legal regulations. Furthermore, the prolonged duration of the flow heightens the potential for user distraction, a factor we must acknowledge even if it's not preferable.
Solution: Bypass the linear flow concept! Instead, let's direct users to the appropriate level at each entry point. To facilitate this, we require a simple registration process to efficiently capture user data. It can simply be an email/phone number and a password or implementing email/phone verification.
- 2. Complexity of different possible states:** Users may encounter waiting periods, may need to contact the Sajam organization to update their status, and numerous other states that could impede their progression through various steps of the flow.
Solution: We should add an additional section into our framework specifically designed to inform users about their current state and provide corresponding solutions for each situation.

As a result, the following was achieved:

Having established the framework for the flow map, the next step is to develop and integrate the details based on the Sajam API documentation, the Security & Exchange Organization documentation, and our understanding of different levels.

The names and expanding Design system

We created wireframes for two primary reasons:

1. To identify the components that require enhancement in our design.
2. To articulate and define the overall stylistic concept.

Following that, we initiated the expansion of our design system by incorporating essential components, including more input fields, progress bars, upload document cards, and multi-choice question cards. It's crucial to note that these design components initially served as conceptual frameworks, and we made adjustments to better align them with our specific requirements before finalizing the design shots.

Online Trading User Code knowledge Assessment Exam

Q3 of 10

Which option is the correct start and end time of the Iranian OTC market?

☐ 8:30 to 12

☐ 9:30 to 12

☐ 8:30 to 14

☐ 9 to 16

Next >

 → 

We found your profile in Sajam data base with national ID of 0022372810

By entering the code sent to the mobile phone number registered in Sejam, Arman Brokerage will receive your registration information from Sejam.

Send code

Your information has been successfully sent to the Sejam system. Wait for an SMS containing a 10-digit code from Sejam.

B

Visibility of status as challenge 🤔

We understand that we are dealing with a lengthy and intricate process, with each page indicating the current step and guiding users on what they need to do to proceed. The challenge lies in **informing users about their position in the flow, the number of remaining steps, and whether they can backtrack to modify information**. It becomes more complex when considering **whether users should be aware of every detail or only essential information**. Determining the boundaries is a significant challenge!

We will assess the flow from the user's perspective to evaluate the effectiveness of our solution:

First appearance of a progress bar

This is the progress bar, visible on top of each page throughout the entire flow. We have clearly indicated the current level, provided the title of that level, and included a brief explanation of the current step within that level. It will advance until all tasks within the current level are completed.

How do we count?

We opted to measure progress based on the user's activity rather than logical segmentation. This decision stems from the recognition that emotions and feelings play a crucial role, often outweighing the significance of the actual experience itself.

User is back after a waiting gap

Upon the user's return to continue the process, they will encounter a dashboard featuring a card that provides the following information:

- #1. The flow includes three levels.
- #2. Clear indication of completed levels.
- #3. An update on the user's current status and guidance for the next step.
- #4. Listing of remaining levels.
- #5. A reminder of the final prize for successfully completing the entire flow.
- #6. The score that users will receive is equivalent to a two-month subscription of Metawave, an application specialized to assist traders in the Iranian stock market.

B

1. Rather than overwhelming users with excessive information, we provided them with concise updates throughout the process. This strategy is aimed at boosting the conversion rate.
2. We incorporated a gamification principle suggesting that users are more inclined to complete a task when they sense they are nearing its conclusion.
3. To prevent user apprehension due to a lengthy form, we segmented long forms into manageable, smaller steps.

"I got problem!" user's said 🙋

During user testing, we realized a lack of a proper way for customers to get in touch with customer support. The early solution was to consider a fab button or card regarding this matter. However, these questions and points came to my mind during the analysis of this solution:

1. What about user freedom? The current level is enough or we should do anything about it?
2. The flow is somehow designed to ease users leaving the process and coming back later.
3. What resources do we have for customer support?
4. Do we have any other customer support solution in the website? How can we design in consistent with other solutions?

Same side menu as Club panel! why?

1. To ensure design consistency with other pages within the club.
2. To prevent users from feeling stuck in the process.
3. To guide users through different sections without necessitating the closure of the current tab in the browser.

B

Two points on Sign contract page 📝

- ✂ We noticed that the names of the contracts didn't clearly convey their purposes. Consequently, we've decided to include concise explanations, arranged with low hierarchy, for individuals who prefer a brief overview without delving into the entire contract but still want to understand what they are signing.
- ✂ There are four contracts for users to sign, with three being mandatory and one optional. The optional contract enables users to trade online, as opposed to having to visit a brokerage branch in person. To minimize the likelihood of users unchecking this option:
 1. We have pre-checked the checkbox for this contract.
 2. In addition to stating the contract's name or providing an explanation, we have included a description of **the impact of this decision on the user's activity**.
 3. If the user decides to uncheck it, they will receive an alert to confirm their understanding of the consequences of their decision.

Electronic Securities Purchase and Sale Agreement (Offline)
